

## Read me

This application displays different videos extracted from a JSON file. At first, the user only sees thumbnail of the videos. When the main thumbnail is clicked, it became a video that can be played paused and advanced directly with the progress bar. A description of the video is displayed after 25% of the video has been seen. When another thumbnail is clicked, it became the main thumbnail and displays the other thumbnails below it.

When a video is played, there is a full screen button after the other controls for the video. When this button is clicked, the video fills the browser. In this full screen mode, videos are played one after the other without any event from the user. To quit this full screen mode, there is a button after the other controls displayed but the user can also press enter to go back to the default mode.

When a video is played and then paused, if a user refreshes the page and choose the same video, this one will continue at the same time that the user paused it.

At the beginning, the thumbnails are displayed in a way that the videos the user has already seen will be at the end and the videos not seen by the user will be in a random order.
